3. PREPARATION FOR START

1.Oiling (Fig.1)

Oiling is imperative to keep the machine in good operating condition. Pour oil in the reservoir (capacity 45 cc). To begin the flow of oil to the machine, push the button of the lubricator ten times continuously before starting the machine. This should dispense enough oil for an average running of four hours under normal operating conditions. Do not run the machine without oil as it could causes a machine failure or break down.

Fig. 1

2.Needle Setting (Fig.2, 3, 4)

Turn the pulley until Needle Bar reaches its highest position. Loosen Needle Bar Clamping Nut, and set Needle in the Bar as deep as it will go.

Be sure to set a Needle with its concave part facing correctly toward the Loper. Fix Clamping Nut tightly, otherwise Needle may come loose during operation and break.

Fig. 2

3.Threading(Fig.5)

The machine is delivered being threaded to show you proper threading of the machine, which is shown in Fig.5, for identification. Follow the guide numbers 1 to 7 of Fig.5.

5. ADJUSTMENTS

Important !

When adjusting the machine or replacing parts, always disconnect the Electric Cord from the power source.

This is important in view of safety to the operator and adjuster.

1. Thread Tension (Fig.10)

The thread tension spring is preset at the factory to sew PP woven cloth bags. If some adjustment is needed, first loosen screw (A) (9/64S40005) and adjust the thread tension nut (B) (245092) as per Fig.10. When the adjustment is finished, retighten screw to lock the thread tension nut.

If this is not done, the stitch will not remain uniform.

2. Position of Needle and Loper (Fig.11)

Looper must pass the concave part of Needle with clearance of 0.1 mm as shown in Fig.11. Adjustment of the clearance can be done after loosening the screw of Loper Rocker.

3. Position of Feed Dog (Fig.12)

When installing a new feed dog ensure that it is positioned correctly onto the feed dog carrier block and lightly tighten the fixing screw. Check that the feed dog teeth are 2.8mm above the throat plate when the feed dog is in the highest position before final tightening of the fixing screw.

4. Pressure of Presser Foot

When to adjust the pressure of Presser Foot, take out Needle Bar Guard and loosen Screw of Presser Bar Connection. Move up Presser Bar to increase the pressure and down to decrease. After the adjustment, tighten the Screw firmly.

5. Pressure Foot Lifter

The Presser Foot Lifter is used to lift the Presser Foot and pull out a bag from under the Presser Foot in case of a problem such as bag or thread jamming.

6. How to use Hook (Part No.241151)

The Hook on the Pulley Cover is used to install a Shoulder Belt or a Hanger.

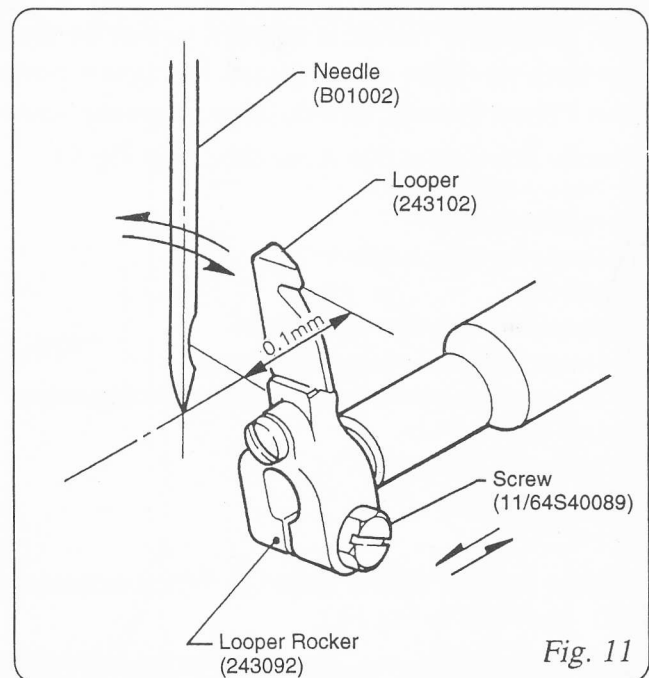

Fig. 11

Fig. 12

7. LUBRICATOR

1. Operation

The lubricator comprises a pump and a reservoir. The reservoir holds max 45 cc of oil. (Effective oil volume is 28 cc.)

Use mineral oil 22 - 32 cSt at 40°C (Eg. Tellus oil #32).

To operate the lubricator:

1. First unscrew the reservoir cap by half a turn.*
2. Push the button to its lowest position (stroke: 12mm).
3. When released, the button will automatically return to its original position.
4. Lastly, tighten the cap to prevent oil leak during operation.

* Repeated working on the button without first loosening the cap may produce negative pressure in the reservoir, and the dust in the atmosphere may be easily introduced in it when the cap is loosened.

2. Maintenance

1. Keep off dust or foreign matter when to fill oil (They may cause jamming of the piston and the check valve).
2. Rate of discharge is fixed and not adjustable (0.08cc per push).
3. At high temperatures, grease may run along points (A). This is normal, grease being used when the lubricator was assembled in our plant.
4. Reservoir is made of high density polyethyiene. Keep off fire and refrain from using organic, benzene, or xylene chemicals for cleaning. Check periodically for correct working of the pump. (Repeat oil feed and look at the oil through the discharge pipe.)

3. Troubleshooting

Trouble	Cause	Remedy
Oil not fed.	Low oil level.	Fill oil.
Full stroke movement not obtainable.	Dust attached on the interior wall of the pumping chamber.	Replace lubricator.
Button will not return.	Dust accumulated, or break of spring.	Replace lubricator.
Oil leak from (A)	Wornout or displaced seal of O-Ring.	Replace lubricator.
Oil leak from (B)	Wornout or displaced seal of packing.	Replace lubricator.
Oil leak from (C)	Loose plug.	Tighten plug or Replace lubricator.

PUSH-BUTTON LUBRICATOR Model: NP-7A

8 . MAINTENANCE

Clean the machine at the end of the day's work, and oil the bushings, shaft, etc. that are not lubricated by a lubricator. Wipe dust and other foreign matter off the Feed Dog teeth Looper and Throat Plate eyelet where they are easily gathered.

Care should be taken to keep the machine free from dust, especially when to leave it unused for some time.

Important !

The motor body should not be opened for the maintenance.

When adjusting the machine or replacing parts, always disconnect the Electric Cord from the power source.

This is important in view of safety to the operator and adjuster.

[NOTES ON CARRYING AND STORAGE]

1. Carry the machine in a storage box.
2. After the use of the machine, remove the plug, clean the dirt, take the thread from the machine and then put it into a storage box.
We suggest you to use a soft brush to clean the rear of the machine.
3. Never store the machine under the sunlight dried or wet condition.

[CAUTION]

When operate the machine, do not put it on the table. The machine is not a table top type.

6. REPLACING PARTS

For replacement or adjustment of Ball Rod, refer to Fig.13.

Take out Screw ① and disconnect Rod End ② from Needle Bar Lever ③. After loosening the Nut ④, adjust the clearance between Connecting Rod ⑤ and Rod End ②, so that Needle Bar moves in the center of the clearance between the upper and lower Presser Bar Bushings. (Needle Bar stroke is 37 mm).

To fix Eccentric Cam ⑦ on Main Shaft ⑧, tighten the Screws ⑨ and ⑨ on Main Shaft ⑧ (Eccentric Cam ⑦ should contact Spacer ⑩ slightly.). The position of Needle is adjusted so that the distance between the point of Needle (at its highest position) and Throat Plate is 13 mm, after loosening screw on Needle Bar Connection Assembly ⑥ in Fig.13.

a) Apply the Screws ② and ② on the taper of Main Shaft ①.

b) Adjust Arm (B) ④, so that Looper Drive Cam ③ and Arm (A) ⑤ move smoothly. After adjusting, fix the Screw ⑥ tightly.

c) The clearance between Looper Drive Cam ③ and Arm ⑤ is effected by Spring ⑦. Loosen Screw ⑨ and turn Spring Supporter ⑧ to adjust the pressure of Spring ⑦. After adjusting, tighten the Screw ⑨ to fasten Spring Supporter ⑧.
